

# User Guide

Version 1.0

## How to use this tool :

This tool requires 3 parameters:

- file type: txt or xml.
- searchText: text to search in the file.
- replaceText: text to replace searchText in the file.

Sample of use:

```
>searchreplace.exe txt "customer" "client" < manifesto.txt > result.txt
```

To avoid issues with special characters, parameters must be quoted with “ ”.

Notes:

- 1- “< manifesto.txt” and “> result.txt” are not part of the application parameters but are used to redirect the contents of “manifesto.txt” to the standard input of the application, and to redirect the standard output of the application to “result.txt”.
- 2- A log file with the name “log.out” will be generated in the current directory.
